How will cathode technology change the price of cobalt metal?

As the cathode material technology matures, manufacturers will require less frequent design changes leading to longer plant life and lower depreciation costs. The price of cobalt metal has changed in the last six years from a peak of \$27 per kg to a low of \$22 per kg .

How much would a 20% reduction in the price of cobalt nmc532 cost?

The price of cobalt metal has changed in the last six years from a peak of \$27 per kg to a low of \$22 per kg . Thus, a 20% reduction in the price of cobalt from the value used in this study (\$26.3 per kg) would reduce the price of the NMC532 by \$1.02 per kg.

Does raw material cost affect lithium-ion battery pack prices?

The analysis shows that each material only contributes a minor share to total raw material cost. In addition, total raw materials cost only constitute a share of total product price. The cost increase of one raw material will therefore only have a limited impact on lithium-ion battery pack prices.

How much will NMC cathode material cost?

This combination of changes indicates the possibility of the NMC cathode material price approaching \$20 per kg, or 19% less than the base case scenario. There are yet other cost-cutting measures that can drive the cost down even further. Fig. 6.

Can lithiated nickel manganese cobalt oxide be produced by co-precipitation?

A process model has been developed and used to study the production process of a common lithium-ion cathode material, lithiated nickel manganese cobalt oxide, using the co-precipitation method. The process was simulated for a plant producing 6500 kg day<sup>-1</sup>.
